APPENDIX 13-A. UTILITY IMPACT ANALYSIS: HIGH AND LOW ECONOMIC GROWTH RESULTS

13-A.1 INTRODUCTION

As described in chapter 13, Utility Impact Analysis, DOE analyzed the effects of residential heating products standard levels on the electric and gas utility industry using a variant of the DOE/Energy Information Administration (EIA)'s National Energy Modeling System (NEMS).^a NEMS is a public domain, multi-sectored, partial equilibrium model of the U.S. energy sector. Each year, DOE/EIA uses NEMS to produce a baseline energy forecast for the United States, the *Annual Energy Outlook* (*AEO*). The *AEO* for 2009 (*AEO2009*) forecasts energy supply and demand through 2030.¹ DOE used a variant of this model, referred to here as NEMS-BT,^b to account for the impacts of heating products energy conservation standards on the baseline energy forecast. Chapter 13 describes DOE's utility impact analysis consists of a comparison between model results for the *AEO2009* Reference Case and for policy cases in which standards are in place, and applies the same basic set of assumptions as the *AEO2009*. This appendix consists of a comparison between the modeled results for the *AEO2009* High and Low Economic Growth Case forecasts and policy cases in which standards are in place.

This appendix reports the changes in installed capacity and generation that result for each trial standard level (TSL) by fuel type, as well as changes in residential electricity and natural gas consumption for AEO's high and low economic growth forecasts.

13-A.2 ASSUMPTIONS

NEMS-BT has several advantages that have led to its adoption as the forecasting tool in the analysis of energy conservation standards. NEMS-BT uses a set of assumptions that are well known and fairly transparent, due to the exposure and scrutiny each *AEO* receives. In addition, the comprehensiveness of NEMS-BT permits the modeling of interactions among the various energy supply and demand sectors and the economy as a whole, producing a complete picture of the effects of energy conservation standards. Perhaps most importantly, NEMS-BT can be used to estimate marginal effects, which yield a better estimate of the actual impact of energy conservation standards than considering only average effects.

The utility impact analysis uses the assumptions of the *AEO2009* and treats water heater, pool heater, and direct heating equipment energy conservation standards as variations in policy. The effect of the policy is calculated as the difference between the *AEO2009* High and Low Economic Growth Cases and each proposed standard case. Because the implementation of

^a For more information on NEMS, refer to the U.S. Department of Energy, Energy Information Administration documentation. A useful summary is *National Energy Modeling System: An Overview 2003*, DOE/EIA-0581(2003), March, 2003.

^b DOE/EIA approves use of the name NEMS to describe only an official version of the model without any modification to code or data. Because this analysis entails some minor code modifications and the model is run under various policy scenarios that are variations on DOE/EIA assumptions, DOE refers to it by the name NEMS-BT (BT is DOE's Building Technologies Program, under whose aegis this work has been performed). NEMS-BT was previously called NEMS-BRS.

standards reduces total natural gas demand by less than one percent in any given year, its effect cannot be detected directly in the simulations. Therefore, DOE modeled larger reductions in demand and interpolated results for the TSLs. DOE assumed the effects to be linear within the range of interpolation.

13-A.3 METHOD

DOE used the national energy savings developed in the national impact analysis (chapter 10) for each TSL as input to NEMS-BT. The magnitude of the energy decrement that would be required for NEMS-BT to produce stable results out of the range of numerical noise is larger than the highest efficiency standard under consideration. Therefore, DOE estimated results corresponding to each TSL using interpolation. DOE ran higher use reduction levels in NEMS-BT, representing multipliers of each TSL, and used these outputs to linearly interpolate the results to estimate actual changes in generation and capacity due to the standard.

Policy runs are executed by reducing electricity and natural gas consumption in the NEMS-BT Residential Demand Module. Energy use reductions are applied to the residential water heating end use for water heaters and pool heaters and to the residential heating end use for direct heating equipment. The savings are divided evenly among the U.S. Census divisions. All fuels are considered simultaneously.

Although the current time horizon of NEMS-BT is 2030, other parts of the residential heating products energy conservation standards analysis extend to the year 2045 for water heaters, and 2043 for direct heating equipment and pool heaters. It is not feasible to extend the forecast period of NEMS-BT for the purposes of this analysis, nor does DOE/EIA have an approved method for extrapolation of many outputs beyond 2030. While it might seem reasonable to make simple linear extrapolations of results, in practice this is not advisable because outputs could be contradictory. For example, changes in the fuel mix implied by extrapolations of those outputs could be inconsistent with the extrapolation of marginal emissions factors. An analysis of various trends sufficiently detailed to guarantee consistency is beyond the scope of this work, and, in any case, would involve a great deal of uncertainty. Therefore, all extrapolations beyond 2030 are simple replications of year 2030 results. While these may seem unreasonable in some instances, in this way results are guaranteed to be consistent. As with the AEO High and Low Economic Growth Cases in general, the implicit assumption is that the regulatory environment does not deviate from the current known situation during the extrapolation period. Only changes that have been announced with date-certain introduction are included in NEMS-BT. To emphasize the extrapolated results wherever they appear, they are shaded in gray to distinguish them from actual NEMS-BT results.

13-A.4 RESULTS

The utility impact analysis reports NEMS-BT forecasts for generation, installed capacity, and residential-sector consumption. Results are for all TSLs are presented in five-year increments to year 2030. Beyond year 2030, an extrapolation to 2045 for water heaters, and 2043

for direct heating equipment and pool heaters for each proposed TSL represents a simple replication of the year 2030 results.

The results from the *AEO2009* High Economic Growth Case and Low Economic Growth Case are shown in Tables 13A.4.1 and 13A.4.2, respectively.

A separate set of TSLs are modeled for each energy conservation standard product. Eight TSLs are modeled for residential water heaters, six TSLs for direct heating equipment, and six TSLs are modeled for pool heaters. The high economic growth case results for each TSL are presented in Table 13-A.4.3 through Table 13A.4.22. The high economic growth results from proposed water heater TSLs are presented in Table 13-A.4.3 through Table 13-A.4.10, the high economic growth results from proposed direct heating equipment TSLs are presented in Table 13-A.4.11 through Table 13-A.4.16, and the results from proposed pool heater TSLs are presented in Table 13-A.4.17 through Table 13A.4.22. The low economic growth case results for each TSL are presented in Table 13A.4.23 through Table 13A.4.42. The low economic growth results from proposed water heater TSLs are presented in Table 13A.4.23 through Table 13A.4.30, the low economic growth results from proposed direct heating equipment TSLs are presented in Table 13A.4.31 through Table 13A.4.36, and the results from proposed pool heater TSLs are presented in Table 13A.4.37 through Table 13A.4.42.
